

CONSTITUTION: This device is constituted of an ultrasonic diagnostic device 1 which obtains an ultrasonic diagnostic image(moving image), an AD/DA converter 5 which digitizes the moving image and analogizes an image signal, a compression/expansion part 6 which expands or compresses the image signal, a control part 7 which issues an instruction for recording/reproduction, etc., to every constitutional part, an image data buffer device 8 which always holds the fixed quantity of compressed data transiently, and recorder 9 which records the image data. In the device, the recording is started from moving image data before prescribed time when an instruction to start the recording is issued.

ABSTRACT

PURPOSE: To provide an image data system and an optical disk which can speedily retrieve information recorded on the optical disk.

CONSTITUTION: The optical disk on which information can be recorded has a user data area 110 and a data management area 125 where management information for managing the information recorded in the area 110, and the user data area 110 includes a data area 112 where principal information is recorded and a retrieval information area 114 where retrieval conditions for retrieving the information recorded in the area 112 and information regarding the data area 112 corresponding to the retrieval conditions are recorded. The information recorded in the data area 112 can be retrieved on the basis of the management information recorded in the data management area 125, but when desired retrieval information is recorded in the retrieval information area 114, the target information can speedily be retrieved by retrieving this area 114.
